vibers™ is a new material made from Elephant grass.

Elephant grass grows on local soil, on fallow land and is a very special plant. It takes up 4 times more CO₂ than a forest with trees, grows on poor soil, without the use of pesticides and needs little water. **vibers™** uses modern technology to make new products that are better for the environment. Natural fibers, strong, durable and beautiful.

You have something special in your hands...

vibers™ uses existing molds for the production of the desired products. We prefer to reuse existing molds rather than recommissioning new ones. With our material we can thermoform packaging materials, for example for tomatoes, cookies and your slices of cheese. We use much lower temperatures for this than usual and therefore we save a lot of energy, which is cheaper and better for the environment.

Our mission

vibers™ has a mission: soon everyone will have products of **vibers™** at home. Because then we have made a real impact and have replaced other, polluting, materials. **vibers™** products are available for production companies in the form of granules and foil for thermoforming. The product is always marketed under the name **vibers™**.

From locally grown Elephant grass

Natural look

The trays for cheese, vegetables and fruit are characterized by a beautiful natural appearance. The consumer will be more inclined to take this tray from the shelf than a plastic one. Consumers may dispose of **vibers™** packaging as biodegradable waste if it is labelled with the Seedling logo.
